

PlayIQ Capstone: The Master Trial

Your final mission: learn it, perform it, build it, and own it

Look at what you can do now.

You can ask a better question. You can pre-learn a hard topic, find a missing connection, compress information, quiz yourself, learn from mistakes, organize knowledge, protect your voice, build a personal tutor, and design for a real user.

Now you will connect those powers.

The Master Trial is not one giant exam and it is not a victory lap made of checkmarks. You will use the full PlayIQ system on one real learning challenge, complete a performance event, create something that matters to you, prepare a Learning Dashboard, finalize your tutor files, and explain the evidence to your parent or guardian.

****By the end of this Capstone, I can independently plan, learn, perform, create, verify, and improve—with AI supporting my thinking rather than replacing it.****

Your final portfolio will contain:

1. an Exam & Performance Plan;
2. a before-and-after performance evidence set;
3. one selected creation-track build;
4. a Learning Dashboard;
5. a final Personal Tutor Project Pack;
6. a Parent Review Packet;
7. a student ownership statement and next plan.

Part 0: The 30-second possibility pick

If Orion gave you one hour to begin making an idea real, which door would you open first?

- ☐ Build a prompt system that turns a confusing task into clear steps.
- ☐ Design a game world and playable challenge.
- ☐ Sketch an object that solves a physical problem.
- ☐ Invent a recipe or meal-planning helper.
- ☐ Create a safe expense-organizing assistant.
- ☐ Build a dashboard that reveals how you are learning.

My first choice: _____

What makes that possibility exciting to you?

There is no wrong door. Today you are choosing where to focus your imagination.

You will still build the Learning Dashboard because it helps you see the evidence behind your progress.

ORION: "At the beginning, the genie asked what you wished to make possible.

Now you have tools. Your question is no longer only, 'What do I wish for?' It is, 'What can I learn, test, and build next?'"

Part 1: Choose the Master Trial learning challenge

Select a real topic, unit, skill, or upcoming assessment. It must be safe, school-approved when applicable, and possible to practise during the Capstone.

Examples:

- a science unit you need to explain;
- a math skill with several problem types;
- a history question requiring claim, evidence, and reasoning;

- a language presentation;
- a practical skill with a demonstration or teach-back.

My challenge: _____

Why it matters now: _____

What successful performance would look like:

What I already know:

What currently feels uncertain or overwhelming:

Approved source materials I can use:

Date of the real or practice performance: _____

Why this matters

A clear challenge gives your learning system a target. You are not trying to "get smarter" in general. You are deciding what you need to understand, what you need to produce, and what evidence will show whether your plan helped.

Part 2: The Exam & Performance System

The older Exam & Performance System now lives inside the Master Trial. It is the sequence you use to prepare, perform, and learn from the result.

The six-stage performance loop

1. **Define** — understand what the performance actually requires.
2. **Map** — pre-learn the topic and locate the hard parts.
3. **Rescue** — repair missing connections.

4. **Practise** — retrieve, apply, explain, and use the Mistake Bank.
5. **Perform** — complete a timed or realistic attempt without hidden help.
6. **Review** — compare evidence and choose the next improvement.

This is not cheating. Preparation makes the real event feel more familiar.

The real advantage is learning how to learn sooner, with less wasted effort, while still doing the thinking and practice yourself.

Stage 1 — Define the performance

What will I be asked to do?

What formats might appear? ☐ explain ☐ solve ☐ compare ☐ create

☐ present ☐ other: _____

What source tells me this? _____

What rules, time limits, or materials apply?

What remains unknown and who can answer it?

Stage 2 — Map the topic

Create a quick map before studying deeply.

TOPIC:

BIG IDEA:

3–5 CORE PARTS:

1.

2.

3.

4.

5.

KEY TERMS:

LIKELY HARD PART:

SOURCE(S):

Why this matters: the map makes the territory visible. It does not replace

learning the details; it helps you see where those details belong.

Stage 3 — Rescue the missing connection

Complete this sentence:

I understand _____, but I lose the connection when

_____.

Ask Orion:

Ask me three short questions to locate the exact missing connection. Explain

only that part using one example. Then ask me to explain it back. Do not

complete my final answer.

The missing connection was:

The repair that helped:

How I checked that I understood:

Stage 4 — Build the practice set

Prepare:

- three easy retrieval questions;

- three medium application questions;
- two challenge questions;
- one explain-it-in-your-own-words task;
- one common-mistake test.

Keep answers separate until after your attempt.

Practice source and provenance:

Stage 5 — Complete a realistic performance

Set conditions that match the real event as closely as is safe and reasonable.

Attempt type: ☐ written ☐ spoken ☐ problems ☐ demonstration

Time available: _____

Help allowed during the attempt: _____

Start time: _____ End time: _____

I completed the attempt without Orion supplying final answers: ☐

Stage 6 — Review the evidence

Do not ask only, "What score did I get?" Ask what the evidence teaches you.

What I did accurately:

What I could explain clearly:

Mistake or hesitation pattern:

What I corrected without help:

What still needs a hint, source, teacher, or more practice:

Part 3: Active comparison — first attempt vs. prepared attempt

Why this experiment matters

You need an honest comparison to decide which learning actions helped. You do not need an invented PDI score or a fixed improvement target.

Use two comparable tasks on the same topic:

- **Attempt A — starting snapshot:** complete a short task before the full performance loop.
- **Attempt B — prepared performance:** complete a different but comparable task after using the loop.

Do not repeat the exact same questions and call memory "improvement."

Comparison record

Evidence	Attempt A	Attempt B
Correct or complete items	____ / ____	____ / ____
Concepts explained accurately	____ / ____	____ / ____
Mistakes self-corrected	____	____
Hints needed	____	____
Time used	____	____
Frustration (1 low–5 high)	____	____
Confidence before attempt (1–5)	____	____
Confidence after checking (1–5)	____	____

Were the tasks comparable? Why?

Which change is supported by the evidence?

Which change cannot be concluded from this comparison?

What else could have affected the result?

Honest interpretation

- More correct work may show stronger understanding, but check task difficulty.
- Fewer hints may show independence, but only if the tasks were comparable.
- Faster work is useful only when accuracy and reasoning remain strong.
- Higher confidence is useful only when it matches checked performance.
- One disappointing attempt is a clue for the next plan, not proof that the

learning method or student cannot improve.

No approved PDI formula is used here. If PlayIQ later provides an approved calculation, it must show its formula, source data, and limitations before you or your parent relies on it.

Part 4: Final learning discovery conversation

Answer these six questions using evidence from the course.

1. Which learning move most often helped you get started?

2. Which move helped you when the first explanation failed?

3. Which method seemed useful only under certain subjects or conditions?

4. What mistake pattern taught you the most?

5. How has your use of AI changed from answer-seeking to learning or building?

6. What does your tutor still not know about you?

ORION: "Your evidence is a map, not a cage. Keep the routes that help.
Retest the routes when the terrain changes."

Part 5: Learning Supercharger Blueprint — final course update

Your final Blueprint is still a living set of **testable tutor settings**. Do
not lock yourself into a permanent learning-style identity.

Blueprint review table

Setting	Evidence source	Current status	Keep, revise, or retire?	Review condition
explanation-start	Module 0 and later tests	_____	_____	_____
prompting/question rule	Module 1	_____	_____	_____
verification rule	Module 2	_____	_____	_____
pre-learn rule	Module 3	_____	_____	_____
rescue rule	Module 4	_____	_____	_____
compression rule	Module 5	_____	_____	_____
quiz/mistake rule	Module 6	_____	_____	_____
knowledge-file rule	Module 7	_____	_____	_____
writing-coach rule	Module 8	_____	_____	_____

tutor-session behavior	Module 9	_____	_____	_____
real-user build loop	Module 10	_____	_____	_____

Final Blueprint record

```

module: capstone
blueprint_status: living_settings_not_fixed_labels
settings_kept:
- [setting with evidence source]
settings_revised:
- [old setting -> new setting, with reason]
settings_retired:
- [setting and reason]
pending_validation:
- [unknown or setting needing more evidence]
next_review_condition: [new subject, new challenge, or scheduled review]
student_approved: [yes | revisions_needed]

```

Part 6: Choose one creation track

Choose one track for a meaningful build. A thoughtful first version is enough;

you are not required to ship a commercial product.

Every track must show:

- what you wanted to make possible;
- what question you asked;
- what you learned;
- what you created;
- what AI contributed;
- what you checked yourself;
- what remains uncertain;
- what you would improve next.

Track 1 — Prompt Engineer

Build a reusable prompt system for a real task.

Required pieces:

- problem and user;
- input checklist;
- prompt template with placeholders;
- output format;
- verification checklist;
- three different tests;
- revision log.

Example: a prompt system that turns class notes into student-checked retrieval questions without inventing facts.

Track 2 — Game Design Engineer

Design a game world, rules, player goal, challenge loop, and playable concept or prototype plan.

Required pieces:

- player and purpose;
- world and goal;
- rules and choices;
- win, loss, or progress conditions;
- one paper or digital test;
- player feedback;
- next prototype change.

AI may brainstorm possibilities. You choose, combine, test, and explain the design.

Track 3 — Physical Object Dream Creator

Turn an imagined object into a researched concept and prototype plan.

Required pieces:

- problem the object addresses;
- user and setting;

- labelled sketch;
- size, materials, and key features;
- safety and feasibility questions;
- source-backed research notes;
- paper, cardboard, model, or digital prototype plan.

Do not claim that an untested design is safe, manufacturable, or ready to sell.

Track 4 — AI Chef

Create a recipe, meal, or food-planning assistant for an approved user.

Required pieces:

- user's goal and preferences;
- parent-confirmed allergy and safety boundary;
- available ingredients or constraints;
- assistant instructions;
- one generated plan or recipe;
- adult review of food safety and suitability;
- taste/usefulness feedback and revision.

AI does not replace medical advice or adult food-safety judgment.

Track 5 — Personal Expense Assistant

Design a privacy-safe prototype that helps organize sample or parent-approved expense information.

Required pieces:

- purpose and user;
- categories and input format;
- fictional or approved sample data;
- summary and question workflow;
- privacy, decision, and accuracy boundaries;
- one test and revision.

The assistant does not access accounts, move money, recommend investments, or

make financial decisions.

Track 6 — Learning Dashboard Builder

Create a dashboard that makes your learning evidence easier to understand.

Required pieces:

- topics studied;
- confidence before and after checking;
- mistakes or confusion patterns;
- practice completed;
- methods tested;
- next learning step;
- source and status for each entry.

You will complete this dashboard in Part 7 even if another track is your main creation build.

My chosen main track

Track: _____

The possibility I want to explore:

The smallest useful version I can complete:

The evidence that will tell me whether it works:

Part 7: Build the Learning Dashboard

Why this matters

A dashboard is not decoration and it is not a machine that declares how smart

you are. It organizes evidence so you can notice patterns and decide what to do next.

Your dashboard may be a table, spreadsheet, sketch, presentation, or app prototype. It must remain human-readable.

The five questions your dashboard should answer

1. What have I studied or practised?
2. Where does checked performance match or disagree with my confidence?
3. Which mistakes or missing connections repeat?
4. Which learning methods helped under which conditions?
5. What should I practise next, and why?

Required data record

```
- date: [date]
topic: [topic]
activity: [what was attempted]
source: [module, worksheet, approved test, or student reflection]
confidence_before: [1-5 or not_recorded]
checked_result: [actual result or not_checked]
mistake_or_gap: [observation or none_observed]
method_tested: [method]
help_needed: [none | hint | several_hints | other]
next_step: [specific practice]
evidence_status: [observed | student_reported | experiment_result | missing]
```

Use not_recorded, not_checked, or missing when data does not exist. Do not fill empty spaces with guesses.

Dashboard planning sheet

Dashboard title: _____

Who will use it? _____

Main decision it should support:

Fields I will show:

How I will distinguish checked results from feelings or estimates:

How I will show missing data:

Dashboard pattern interpretation

Write three evidence-backed observations.

1. I notice _____

because the dashboard shows _____.

2. I notice _____

because the dashboard shows _____.

3. I cannot yet conclude _____

because _____.

My next action is _____

because _____.

Part 8: Complete the creation build

Use this build loop for your selected track.

Imagine

What do I want to make possible?

Ask

What better question or prompt will move the idea forward?

Learn

What information or skill do I need before building?

Sources used and what each source supports:

Build

What did I create?

Check

What did I verify myself? How?

Test

Who or what tested the creation? What happened?

Improve

What did I change after the test?

Ownership record

My original decisions and contributions:

AI's contributions:

What I rejected or changed from the AI:

Remaining limitation:

Part 9: Final Personal Tutor Project Pack

Return to the personal tutor Project you built in Module 9. Orion will compile the approved evidence that arrived after each module. You will review every change and update the Project yourself.

Required final files

1. **Project Instruction Set**
2. **Student Tutor Profile Knowledge File**
3. **Learning Rules Knowledge File**
4. **Tutor Test and Revision Log**
5. **Student Setup Checklist**

Required final request to Orion

Orion, compile the learning evidence I approved from my PlayIQ modules.

Separate my Project Instruction Set from my Knowledge Files. Preserve

provenance and mark unsupported information MISSING_INPUT or

pending_validation. Show me a change summary before I copy or upload

anything. Do not invent traits, enter my account, upload files, share the

Project, or claim setup is complete.

Orion should tell you:

I compiled the learning evidence you approved from your PlayIQ modules. I

have separated your Project Instruction Set from your Knowledge Files. Review

them with your parent, then create or update the Project in the approved AI

account and paste or upload them yourself. Test the tutor, decide what to

keep, and ask Orion to revise anything that does not feel accurate.

Final file review

Check	Complete?	Correction needed
Instructions explain, hint, quiz, rescue, and verify	[]	_____
Tutor refuses answer-copying and ghostwriting	[]	_____

Profile uses only approved information	☐	_____
Every personal rule has provenance	☐	_____
Unknowns and pending validation are visible	☐	_____
Private or unnecessary information is excluded	☐	_____
Test log includes observed behavior and revisions	☐	_____
Setup checklist keeps the student and parent in control	☐	_____

Update the parent-approved Project

- ☐ My parent reviewed the final files.
- ☐ I opened the approved frontier AI account myself.
- ☐ I updated the Project Instruction Set myself.
- ☐ I uploaded or replaced only the approved Knowledge Files myself.
- ☐ I reviewed privacy and sharing settings with my parent.
- ☐ I reran explain, hint, quiz, rescue, verify, and integrity tests.
- ☐ I understand how to revise or remove the files later.

No password is shared with Orion. No silent upload, publication, or deployment is part of this course.

Part 10: Parent Review Packet

Your parent does not need a mysterious score. They need clear evidence, honest limitations, and a conversation with you.

Packet contents

- Master Trial challenge and performance conditions;
- Attempt A and Attempt B evidence;
- selected creation-track artifact;
- Learning Dashboard;
- Personal Tutor Project file index and privacy checklist;

- student reflection and next plan.

Parent-student review questions

Student answers first.

1. What can you do now that you could not do—or could not do as independently—at the start?

2. What evidence supports that answer?

3. Where did AI help, and where did you remain responsible?

4. Which result is still uncertain or needs more practice?

5. What privacy, safety, or integrity boundary will you keep?

Parent response:

Next action agreed together:

Parent/guardian signature: _____ Date: _____

The signature confirms that the packet was reviewed. It does not certify a guaranteed grade, a clinical learning profile, deployment, or an unapproved PDI calculation.

Part 11: Proof artifact — PlayIQ Mastery Record

=====

PLAYIQ MASTER TRIAL RECORD

=====

Student: _____

Master Trial topic: _____

Performance format: _____

Exam & Performance loop completed: []

Comparable before/after evidence reviewed: []

Selected creation track completed: []

Learning Dashboard completed with no invented data: []

Final Personal Tutor Project Pack reviewed: []

Parent review completed: []

Evidence-backed improvement observed:

Important limitation or missing evidence:

Creation built:

What the student independently contributed:

Next learning or creation goal:

Student signature: _____ Date: _____

Parent/guardian signature: _____

=====

Mastery Challenge: Teach, demonstrate, and defend your evidence

Complete a written teach-back of 8–12 sentences or a parent-approved 2–4 minute

audio/video explanation.

Include:

1. the main idea of your Master Trial topic;
2. three key terms or parts;
3. one concrete example;
4. one mistake or missing connection and how you repaired it;

5. what your AI tutor did;
6. what you did yourself;
7. one piece of evidence showing change;
8. one limitation or uncertainty;
9. what you created;
10. what you will do next.

Written or recording plan

Main idea:

Key terms or parts:

Example:

Mistake and repair:

AI contribution:

My contribution:

Evidence and limitation:

Creation and next step:

Artifact or approved recording location:

Final ownership statement

Complete in your own words:

I am the owner of my learning and my AI Projects. AI can help me ask, learn,

practise, organize, test, and create, but I remain responsible for

_____.

The next possibility I want to make real is

_____.

Final message from Orion

ORION: "The lamp was never powerful because it removed your need to think.

It was powerful because it made better questions, faster experiments, and new

possibilities available to your imagination. You built the tutor. You tested

the tools. You checked the evidence. The next wish—and the work that makes it

real—belongs to you."

Beta tester feedback — complete only in the beta route

This section is intentionally the final section. Students using the standard

course do not complete it.

1. Which Capstone moment made you feel most capable or excited?

2. Which instruction or requirement was confusing?

3. Did the Exam & Performance loop help you prepare without feeling like extra busywork? Why?

4. Did the Learning Dashboard reveal a useful pattern? If not, what was missing?

5. Did the six creation tracks offer a choice you genuinely wanted to build?

6. Was it clear what Orion compiled, what you uploaded, and what you owned?

7. What would make the Master Trial more exciting, clearer, or more meaningful?
